

Edits

1. During Ticket upload (Add product panel):
 - Replace “Product Name” with “Event Name”
 - Replace “Estimated Delivery Time” with “Event Date”
 - Replace “refund period” with “Event Time”
 - Replace “Category” with “Event Location” (show city in the radial chart)
 - Add Number of tickets*
 - Remove “Revenue vs Spent” from dashboard (add radial instead?)*
 - Add Ticket partner (District/BMS.. etc)

2. Search by product ID is not working (can 2 search boxes be combined into ? 1 search box that can search both ID or name?)

3. On the Buyer portal (purchasing panel):
 - Mention clearly about even details (as uploaded by seller)
 - Remove “Ticket Partner” row (ticket partner is fixed by seller)
 - Change “Transfer details” to “Receivers Details”. - Name, Number (separate fields for each)
 - Description - Seller will transfer the ticket as per details entered here
 - Disclaimer/Caution (clearly visible): “Please ensure the details entered here are correct. Disputes arising from incorrectly entered details will not be considered.”
 - Disclaimer:
 - Please read all the event details carefully before initiating payment
 - Vault is only a mediator ensuring tickets are safely traded - we are not affiliated with the Event Organisers or Ticketing Partners.
 - Terms and conditions (compulsory field to proceed to payment)
 - Razorpay is not collapsing after pmt

4. After the buyer pays, the seller side is not updating, and can't proceed further. Flow breaks here.

Transaction state machine

—— critical handoff (fix first)

- - - - timeout / fallback path

Buyer flow — detailed

Now here is the complete written specification your developer should build against:

Vault — Complete Product Flow Specification v1.0

The core principle

Every state in the system must be stored in the database and be the single source of truth. No UI should derive state from itself — it should always read from the DB. This is what's causing your current bug.

Section 1 — Transaction states (the state machine)

Your DB needs a `transactions` table with a `status` field. These are the only valid values, in order:

`LISTED` → `PAYMENT_PENDING` → `FUNDS_HELD` → `TRANSFER_PENDING` →
`TRANSFER_IN_PROGRESS` → `AWAITING_CONFIRMATION` → `COMPLETE`

Failure/edge states: `CANCELLED`, `DISPUTED`, `REFUNDED`, `SELLER_TIMEOUT`,
`EVIDENCE_TIMEOUT`

Every status change must be logged with a timestamp. This is your audit trail for disputes.

Section 2 — The critical fix (your bug #4)

The flow breaks because after Razorpay captures payment, nothing tells the seller's session that the state has changed to `FUNDS_HELD`.

The fix: Razorpay sends a webhook to your backend on payment capture. Your backend must:

1. Verify the webhook signature (Razorpay provides this — mandatory, prevents fake triggers)
2. Update transaction status in DB to `FUNDS_HELD`
3. Create a push notification record for the seller
4. Send the push/in-app notification to the seller

The seller's page must either poll the DB every few seconds OR use websockets/SSE to receive a live push when their transaction status changes. Polling every 5 seconds is simpler to build and fine for v1.

Section 3 — Seller upload (listing creation)

Fields required:

- Event name
- Event date
- Event time
- Event location (city)
- Number of tickets
- Price per ticket
- Poster/image (optional but recommended)
- Ticket partner (BookMyShow / District / Insider / Other) — selected by seller at listing, not editable after

Warning shown at upload: *"Multiple ticket transfers are prohibited by some platforms. Please verify your transfer option is available before listing."*

The system generates a unique **listing_id** (e.g. VLT-XXXXX). Inventory auto-updates — listing shows "Sold Out" when all quantities are bought.

Section 4 — Buyer purchase flow

Screen 1 — Listing view: Show all event details as uploaded by seller. No ticket partner field visible to buyer (already locked by seller).

Screen 2 — Purchase panel:

- All event details summarised clearly
- Receiver details: Name (text field), Phone number (separate number field)
- Disclaimer block (cannot be dismissed/scrolled past): *"Please ensure the details entered here are correct. Disputes arising from incorrectly entered details will not be considered."*
- Second disclaimer: *"Please read all event details carefully. Vault is a mediator only — we are not affiliated with event organisers or ticketing partners."*
- T&C checkbox (mandatory to proceed — payment button disabled until checked)
- Price breakdown: Ticket price + Vault fee (5%) = Total

Screen 3 — Payment:

- Razorpay payment sheet
- On capture: Razorpay collapses (fix your current bug where it's not collapsing — this is a `razorpay.close()` call on the `payment.success` handler)
- Redirect to Funds Held screen

Screen 4 — Funds held: Message: *"Your payment is secured with Vault. The seller has been notified to initiate transfer."*

Screen 5 — Transfer in progress:

- Appears with a 5-minute delay after seller clicks "Initiate Transfer" (do not show instantly — gives seller time to start)
- Shows countdown (T-15 from seller's initiation)
- Message: *"Seller has initiated the ticket transfer"*

Screen 6 — Confirm receipt: Appears when seller submits evidence (or when 15-minute timer expires). Prompt: *"Has the seller completed the ticket transfer to your account?"*

- YES → transaction moves to **COMPLETE**, payout triggered
- NO → transaction moves to **DISPUTED**, buyer is prompted to upload counter-evidence
- No response in 10 minutes → auto-moves to **COMPLETE**, payout triggered (document this clearly in T&C)

Section 5 — Seller flow

Notification: Push notification + in-app banner: *"A buyer has paid for your listing [Event Name]. Please proceed to transfer the ticket."*

Screen 1 — Instructions (mandatory read):

- *"Buyer has paid ₹[amount]. Please transfer the ticket to [buyer name] at [phone number] via [ticket partner]."*
- *"Take a screen recording of the transfer process. Vault will not entertain disputes without clear evidence."*
- *"You must initiate and complete transfer within 30 minutes."*
- *"Once you click INITIATE TRANSFER, a 15-minute timer will start. You must upload evidence before the timer ends."*
- Button: **INITIATE TRANSFER**

On clicking INITIATE TRANSFER:

- DB status → **TRANSFER_IN_PROGRESS**
- Timestamp recorded
- 15-minute countdown starts on seller screen
- 5-minute delayed notification pushed to buyer

Screen 2 — Evidence upload:

- Countdown visible
- Upload field for screen recording video
- Button: **SUBMIT EVIDENCE**
- On submit: DB status → **AWAITING_CONFIRMATION**, buyer notified immediately

Seller timeout — 30 minutes with no INITIATE action:

- Automated job checks DB every 2 minutes for stuck **TRANSFER_PENDING** transactions
- If 30 minutes elapsed: status → **SELLER_TIMEOUT**, buyer refund triggered automatically
- Seller notified: *"You did not initiate transfer in time. The transaction has been cancelled and the buyer refunded."*

Evidence timeout — 15 minutes from INITIATE with no upload:

- Status → **EVIDENCE_TIMEOUT**, manually reviewed by Vault team
- Neither party receives money until review is complete
- Both parties notified

Section 6 — Dispute resolution

Triggered when buyer clicks NO on confirmation.

Vault admin dashboard shows:

- Seller's uploaded screen recording
- Buyer's stated reason for dispute
- Buyer's option to upload counter-evidence (screenshot of their account showing no ticket received)
- Transaction timeline (every state change + timestamp)

Resolution:

- If seller's evidence clearly shows completed transfer → pay seller
 - If evidence is missing, unclear, or contradicts buyer's claim → refund buyer
 - Target resolution time: 48 hours (set this expectation clearly in T&C)
-

Section 7 — Razorpay implementation notes

Your three open questions, answered:

1. **How long do payouts take?** RazorpayX payouts to seller bank accounts: T+1 days (free) or instant (0.20–0.30% fee). Recommend T+1 for now — lower cost. Budget 24–48 hours in your seller messaging.
2. **How to take your cut?** Do NOT try to split via Razorpay at the time of payment. The cleanest approach for v1: capture the full buyer amount (ticket + 5% fee) into your Razorpay account. When you initiate the payout to the seller via RazorpayX, you pay out (ticket price minus 1.5%). Your cut stays in your Razorpay account balance. This is simpler and fully in your control.
3. **How to reverse payouts to buyers in disputes?** You cannot reverse a payout once sent. This is why you must NOT pay the seller until after the buyer confirms. Refunds go back to the buyer's original payment source (Razorpay refunds API). For instant refunds, budget ₹9.43–₹17.69 per transaction as your cost.

Cost summary per transaction:

- Razorpay capture fee: 2.36% of total
 - Your revenue: 5% (from buyer) + 2% (from seller) = 7% gross
 - Net after Razorpay: approximately 4.6%
 - On a ₹1,000 ticket: you make ~₹46 net per transaction after payment gateway costs
-

Priority order build

1. Fix the Razorpay webhook → DB → seller notification chain (main blockage currently)
2. Fix Razorpay modal not closing after payment
3. Implement the automated timeout jobs (seller 30-min, buyer 10-min)
4. Build the evidence upload + dispute state
5. Build the Vault admin dispute dashboard
