

VAULT

Developer Build Guide — v2 (consolidated)

Fix list + Purchase page spec + User-facing copy across journey | Internal

What's in this document

This document supersedes earlier fix lists (v1, v2, v3). It contains:

- Part A — Prioritised fix list (P0 to P3)
- Part B — Full buyer purchase page spec (replaces fix #6)
- Part C — User-facing copy across the entire transaction journey (buyer + seller)

Build in the order listed in Section 'Recommended build order' near the end of this document.

PART A — Prioritised Fix List

Priority	Meaning	Action
P0	Critical	Security or money-related. Fix immediately.
P1	High	Functional bugs that block normal use.
P2	Medium	UX issues, missing features, things that hurt usability.
P3	Low	Cosmetic, label changes, polish.

P0 — Critical (fix first)

These are blockers. Do not work on anything else until both are resolved and tested.

#1 Regular users can access admin panel

P0 — Critical, fix first

What's broken / needed:

Users who are not admins can reach admin URLs and see admin pages.

Why this matters:

Serious security issue. A non-admin user could trigger refunds, view other users' data, or interfere with disputes. We cannot launch with this open.

What to do:

1. Regular users should be strictly prohibited from accessing the admin panel.
2. Add role-based access control (RBAC). Every user record must have a 'role' field — minimum: 'user' or 'admin'.
3. Protect every admin route on the BACKEND (server-side check). Frontend hiding alone is not security.
4. Any request to /admin/* routes must verify the requesting user has role = 'admin'. If not, return 403 Forbidden.
5. Test by logging in as a regular user and manually visiting admin URLs. Each must be blocked.

#13 Refund button fires an error on admin panel

P0 — Critical, fix first

What's broken / needed:

When admin clicks the Refund button in the admin panel, an error appears instead of processing the refund to buyer.

Why this matters:

Without a working refund, we cannot resolve disputes in the buyer's favour. This blocks our entire dispute resolution flow.

What to do:

6. Fix the refund button on the admin panel – should trigger refund to buyer in a single click.

P1 — High priority

Functional bugs and core features. Fix after P0.

#17 Capture WhatsApp number at signup (NEW)

P1 — High priority

What's broken / needed:

Signup currently doesn't capture WhatsApp number. Needed because we're moving to a hybrid dispute resolution model — email for legal record, WhatsApp for live conversation.

Why this matters:

Without this captured at signup, we can't reach users via WhatsApp during disputes. Capturing it later adds friction at the worst possible moments — when conversion matters most.

What to do:

7. Add mandatory 'WhatsApp Number' field to signup form. Accept +91 prefix and 10-digit Indian mobile numbers.
8. Helper text below field: “Used only for transaction updates and dispute resolution, not marketing.”
9. Validate format: regex `^[6-9]\d{9}$`. Reject anything else.
10. Store with country code prefix (+91XXXXXXXXXX) for direct use in WhatsApp deep links.
11. Add 'WhatsApp Number' field in profile/settings so users can update it later.

DEV NOTE: This number is reused on the buyer purchase page (Field 3 of receiver details) — see Part B.

#9 Wallet balances are not updating

P1 — High priority

What's broken / needed:

The dashboard currently displays three values: Earnings (total INR amount lifetime sold), Pending (total INR amount held due to dispute), and Recovered (total INR amount refunded to buyer). Test and verify if these follow the above logic and update real time.

Why this matters:

Sellers cannot trust the platform if their balances don't reflect reality. This is one of the most visible parts of the seller dashboard.

What to do:

12. Earnings = SUM of (ticket price - 2.5% seller fee) for all transactions where status = 'COMPLETE' for this seller.
13. Pending = SUM of amounts currently held in escrow for this seller — transactions where status is in ('FUNDS_HELD', 'TRANSFER_PENDING', 'TRANSFER_IN_PROGRESS', 'AWAITING_CONFIRMATION', 'DISPUTED').
14. Recovered = SUM of amounts refunded to buyers from this seller's disputed transactions where dispute outcome was REFUND.
15. Test all three: simulate a successful transaction (Earnings rises), dispute in progress (Pending rises), dispute resolved against seller (Recovered rises, Pending falls).

⚠ Test all three wallet values systematically — don't just confirm one is fixed. The bug pattern suggests the calculation logic may be off across the board.

#11 Buyer/seller replies not showing in admin chat thread (Email replies)

P1 — High priority

What's broken / needed:

In the admin dispute panel, when buyer or seller replies to admin's message, their reply does not appear in the thread.

Why this matters:

Without two-way visibility, admin cannot resolve disputes properly — we lose conversation history.

What to do:

16. Check that buyer/seller replies are saved to the database (look at messages table or relation).
17. If saved correctly, the issue is on the read side: admin panel is not fetching all messages for the dispute.
18. Fix the query to fetch ALL messages tied to the dispute_id, regardless of sender. Order by timestamp ascending.
19. Display sender label clearly: 'Admin', 'Buyer', or 'Seller' next to each message.

#2 Add option to update bank account / UPI details

P1 — High priority

What's broken / needed:

Sellers need a way to update payout details (bank or UPI) from profile section. Currently missing.

Why this matters:

Without this, if a seller's bank details change, they cannot receive payouts.

What to do:

20. Add 'Payout Details' section in user profile.
21. Fields: UPI ID (text), OR Bank Account Number + IFSC Code + Account Holder Name.
22. Radio button to choose UPI or bank — only one method active at a time.
23. Validate: UPI matches user@provider pattern; IFSC is 11 chars (4 letters + 7 alphanumeric).
24. Log every change to payout details in an audit table with timestamp. Critical for dispute defence later.

#3 Seller Listing form — fix input field types

P1 — High priority

What's broken / needed:

On the seller's listing form, several fields are plain text fields where they should be specialised input components.

Why this matters:

Plain text fields lead to inconsistent data (one seller writes '7pm', another '19:00', another 'Seven PM'). Breaks search, filtering, and display.

What to do:

25. Event Time: replace text with time picker (scroll wheel on mobile, native time input on desktop). Storage: HH:MM (24-hour). Display: '7:00 PM'.
26. Event Date: replace text with calendar date picker. Disable past dates. Storage: ISO date (YYYY-MM-DD).
27. Event Location: replace expanding list with search-as-you-type city search. Suggest major Indian cities. Store selected city as clean string.
28. Fix general field alignment — fields should be visually aligned in a clean column.

#5 Search bar — merge two bars + fix broken product ID search

P1 — High priority

What's broken / needed:

Two separate search bars exist (name + product ID). Product ID search is broken. Should be one smart bar.

Why this matters:

Two bars is confusing UX. A single bar handling both is industry standard.

What to do:

29. Replace two bars with one. Placeholder: 'Search by event name or product ID'.
30. Backend search query matches against event_name OR listing_id.
31. Detect input: if matches product ID format (starts with 'VLT-'), search by ID exact match; otherwise search event_name (case-insensitive partial match).
32. Fix the existing product ID bug — likely case sensitivity, exact-vs-partial, or wrong field name in query.

P2 — Medium priority

UX and polish. Fix after P1.

#8 Auto-confirm timer — increase to 15 min

P2 — Medium priority

What's broken / needed:

Auto-confirm timer (after seller submits evidence) is too short.

Why this matters:

Some transfers (especially BookMyShow) take a few minutes to reflect on the buyer's side.

What to do:

33. Change auto-confirm timer to 15 minutes.

#10 Buyer evidence upload on dispute

P2 — Medium priority

What's broken / needed:

When buyer raises a dispute, they can only type a message. Should also be able to attach evidence.

Why this matters:

Without buyer evidence, admin only has seller's side — biases outcomes against buyers.

What to do:

34. On dispute submission form, add file upload field below the reason text box.
35. Accept: jpg, png, mp4, mov. Max 25MB per file. Up to 3 files per submission.
36. Save to storage (S3 or equivalent). Store URLs in dispute record (buyer_evidence_urls field).
37. Display in admin dispute panel alongside seller's evidence.

#4 Customer support button — replace with WhatsApp link

P2 — Medium priority

What's broken / needed:

Floating customer support button currently doesn't work. Replace with WhatsApp deep link.

Why this matters:

Users need fast help when something goes wrong with their money. WhatsApp is the default for Indian users.

What to do:

38. Replace broken floating button with 'Need help?' button.
39. Link format: `https://wa.me/<vault-number-with-country-code>?text=<pre-filled-message>`
40. Pre-fill message: “Hi, I’m (username – autofill from sign-in). Looking for some help”
41. If user is logged in and on a transaction page, auto-include transaction ID in pre-filled message.
42. Vault's WhatsApp number to be confirmed.

#14 Connect Vault's official email to admin panel

P2 — Medium priority

What's broken / needed:

Outbound notifications should come from support@vaultpay.co.in

#7 Dark mode text contrast

P2 — Medium priority

What's broken / needed:

Some text is unreadable in dark mode (low contrast, wrong colours).

What to do:

43. Audit every page in dark mode. Look for: low-contrast text, hardcoded white/black colours that don't adapt.
44. Use CSS variables for all text colours (e.g. `var(--text-primary)`) so dark/light mode is handled centrally.
45. Minimum contrast: WCAG AA standard (4.5:1 for normal text). Use free Chrome contrast audit extensions.
46. Replace any hardcoded color: #333 or color: gray with CSS variables.

P3 — Low priority

Cosmetic. Do last.

#16 Wallet labels — rename and add ₹ symbol

P3 — Low priority

What's broken / needed:

Seller wallet labels are confusing. Rename for clarity, add ₹ where missing.

Why this matters:

Clearer labels help sellers understand each number at a glance.

What to do:

47. 'Earnings' — keep label as it is
48. 'Pending Amount' → rename to just 'Pending'.
49. 'Vault Recovered' → rename to just 'Recovered'.
50. Add ₹ symbol prefix to 'Recovered' value. Confirm consistency across all three.

#17 Add ticket listing labels — rename and reorder

P3 — Low priority

What to do:

Rename 'Event Details' to 'Additional Details' and place it below 'Event Location'

PART B — Buyer Purchase Page

This is the full spec for the buyer's purchase page.

Page structure — 3 sections, in order

Section 1: Event Details

Display event information clearly — uploaded by seller. All fields visible to buyer:

- Event Name
- Event Location
- Event Date
- Event Time
- Number of Tickets
- Ticket Partner (e.g. BookMyShow, District, Insider — clearly visible)

△ Above this block, show the warning copy from Part C (Buyer Stage 3, Section A): "Please verify the event details carefully before purchasing."

Section 2: Receiver Details

Message at top of this section: "Tickets will be transferred as per details entered below."

Three fields — all auto-filled from buyer's profile, each with an EDIT button next to it (allowing edit in case buyer is purchasing for someone else):

- Field 1: Name (auto-filled from profile, editable)
- Field 2: Number registered with ticket partner (auto-filled from profile WhatsApp number, editable)
- Field 3: WhatsApp Number — Text below: "For speedy dispute resolution" (auto-filled from profile WhatsApp number, editable)

△ Add cautionary copy below the receiver details block (from Part C Buyer Stage 3, Section B): "Please check the receiver's details carefully — disputes arising from incorrectly entered details will not be considered."

Section 3: Rules & Payment

This section combines critical user-facing terms + the payment action. Layout from top to bottom:

3.1 — 'Before you proceed' block (3 critical pointers, displayed inline):

- ▶ Upon payment your money is held safely with us. We release it to the seller only after you confirm receipt.
- ▶ If the seller fails to comply you will receive a full refund.
- ▶ Vault is a mediator for ticket resale. We are not affiliated with any seller, even organizer or booking partner.

3.2 — Link to full T&C:

Below the 3 pointers, show: 'For full details, please read our complete Terms & Conditions' — where 'Terms & Conditions' is a hyperlink that opens the full T&C in a new tab.

3.3 — Mandatory acceptance checkbox:

Label: "I have read the terms carefully and comply"

Until this checkbox is ticked, the payment button must remain DISABLED (greyed out, non-clickable).

3.4 — Payment button:

Only becomes active after the T&C checkbox is ticked. On click, opens Razorpay payment sheet.

DEV NOTE: Critical UX rule: the payment button must visually communicate its disabled state. Don't just disable on click — show it as disabled by default and only enable on checkbox tick. This prevents users from clicking and getting an error.

PART C — User-Facing Messages (Buyer + Seller)

All user-facing messages across the entire transaction journey. Build these messages into each respective screen exactly as written. Tone has been crafted carefully — please don't paraphrase.

Buyer Journey

Stage 1: After signup (one-time welcome screen)

Purpose: Set expectations before they browse.

- ▶ Vault is a mediator helping people safely trade tickets online by mitigating fraud.
- ▶ For a seamless experience please make sure to read and comply with all instructions while buying or selling.
- ▶ We can only facilitate ticket resales that are transferable in app via respective booking partners.

Stage 2: Purchase page

Purpose: The most critical screen — where most disputes originate. See Part B for full page structure.

Banner above Event Details block:

⚠ "Please verify the event details carefully before purchasing."

Helper text below Receiver Details block:

⚠ "Please check the receiver's details carefully — disputes arising from incorrectly entered details will not be considered."

3 inline pointers in Rules & Payment section:

- ▶ Your money is held safely in escrow. We release it to the seller only after you confirm receipt.
- ▶ If the seller fails to comply you will receive a full refund.
- ▶ Vault is a mediator for ticket resale. We are not affiliated with any seller, even organizer or booking partner.

Stage 3: Payment confirmation (right after Razorpay closes)

Purpose: Reassurance + set what happens next.

- ▶ ✓ Payment secured. Your money is safely held with Vault.
- ▶ The seller has been notified to initiate the ticket transfer within 30 minutes.
- ▶ If the seller fails to comply you will receive a full refund.
- ▶ You will receive a notification when the transfer is initiated.

Stage 4: Transfer-in-progress screen

Purpose: Manage anxiety while seller is transferring.

- ▶ ⌚ Seller has started transferring your ticket. This may take a few minutes.

- ▶ Please check your ticketing app inbox/notifications, including the 'Transferred to me' section.
- ▶ Ensure to accept ticket transfers if required.

Stage 5: Confirm receipt screen (after seller submits evidence)

Purpose: Reduce false disputes from buyers who haven't checked properly.

Display message:

"Seller has confirmed transfer."

Then, BEFORE the YES/NO buttons, prominently display:

⚠ Before tapping NO and raising a dispute, please:

- Open your ticketing app and check the 'Transferred Tickets' / 'My Tickets' section
- Ensure to accept the ticket transfer if required
- Some platforms take time to reflect transfers. Please wait ~5 minutes for tickets to appear.

"If no response, payment auto-confirms in 15 minutes."

Stage 6: Raising a dispute (when buyer clicks NO — popup)

Purpose: Filter out non-genuine disputes before submission.

- ▶ You are about to raise a dispute. Confirm you've genuinely not received the ticket. False disputes may result in your account being suspended or permanently banned.
- ▶ Please describe the issue clearly and attach evidence (screenshot of your ticketing app showing no ticket received).
- ▶ Our team will review evidence from both you and the seller before deciding.

DEV NOTE: Include upload field for evidence + a 'Submit Dispute' button. See fix #10 for technical spec.

Seller Journey

Stage 1: Listing creation page

Purpose: Reduce listing-quality issues at the source.

Above the listing form:

- ▶ Only list tickets you personally hold and can transfer in app.
- ▶ Before listing, please verify with your ticketing partner if the tickets are actually transferable.
- ▶ If the transferred ticket doesn't match your listing details, the buyer will be refunded and you will not receive payment.

Stage 2: Payment notification (when buyer pays)

Purpose: Trigger fast, prepared action.

Header message:

"🔒 Buyer has made payment, which is secured with Vault. Please transfer the ticket as per instructions below to receive your payment."

- ▶ Once you click INITIATE TRANSFER, you will have 15 minutes to transfer the ticket and upload evidence (mandatory).
- ▶ Capture clear evidence of the ticket transfer — ideally record a video from another device (ticketing partners usually block screenshots and screen recordings).
- ▶ Evidence is collected from both parties to settle disputes and prevent fraud.
- ▶ Failure to comply within the stipulated time will auto-cancel the transaction and refund the buyer.

Below all pointers, prominent button:

INITIATE TRANSFER (visually emphasised — italicised, primary button styling)

Stage 3: After clicking INITIATE TRANSFER

Purpose: Reinforce evidence requirement during the active 15-minute window.

- ▶ Transfer the ticket to: [Buyer Name] | [Buyer Number]
- ▶ For evidence — record a clear video of the ticket transfer (start to end) from another device. Please do not delete the recorded evidence until transaction is complete.
- ▶ Absent or unclear evidence may cause you to forfeit the dispute.
- ▶ If you don't complete within the timer, the transaction auto-cancels and the buyer is refunded.

DEV NOTE: Show the 15-minute countdown timer visibly.

Stage 4: Awaiting buyer confirmation

Purpose: Manage seller anxiety + set payout expectations.

- ▶ Evidence submitted. Awaiting buyer's confirmation.
- ▶ Buyer has 15 minutes to confirm or raise a dispute. If no response, payment auto-releases to you.
- ▶ Payout will hit your account within 24-48 hours after confirmation.

Stage 5: If buyer disputes

Purpose: Calm, clear, action-oriented messaging.

- ▶ ⚠ Buyer has raised a dispute. Your payment is held until resolved.
- ▶ Please be patient while our team reviews evidence from both parties to resolve this dispute.
- ▶ We will connect with you via WhatsApp for further information. Please respond promptly for a faster resolution.

Recommended build order

Sequence below. Do not start the next batch until previous batch is tested and confirmed working.

Batch 1 (P0 — start here)

- #1 — Admin panel access control
- #13 — Refund button

Batch 2 (P1)

- #17 — Capture WhatsApp number at signup
- #9 — Wallet calculations
- #11 — Admin chat thread fix
- #2 — Bank/UPI update option
- #3 — Listing form input components
- #5 — Merged search bar
- Part B — Purchase page redesign (this consolidates the user-facing pointers from Part C Buyer Stage 3 as well)

Batch 3 (P2)

- #8 — Auto-confirm timer + buyer instruction copy (Part C, Buyer Stage 6)
- #10 — Buyer evidence upload
- #4 — WhatsApp support button
- #14 — Email integration
- #7 — Dark mode contrast audit
- Remaining user-facing copy from Part C — Stages 1, 2, 4, 5, 7 (buyer) and Stages 1-6 (seller)

Batch 4 (P3)

- #16 — Wallet labels
-
